# Class Test

Student ID:..... Program: B. Sc. in CSE Semester: Spring Year: 2026

Course Code: CSE328 Course Title: Introduction to Data Science Section: 65_J Date:.....

Class Test No: 02 Signature of the Course Teacher:.....

**Q1.** Consider the daily income distribution of rickshaw pullers in Dhaka. On a regular day, most pullers earn between 500 and 700 BDT, with very few earning significantly less or significantly more. The data is symmetrical around the average. During a festive season like Eid, a small number of pullers get extremely high tips and fares (e.g., 2000+ BDT), while the majority still earn the standard rate. This creates a "long tail" that extends towards higher income values. In the Eid season, would the distribution curve be Positively Skewed or Negatively Skewed? Explain your answer by describing where the "tail" of the curve would point and how the extreme high incomes affect the shape of the distribution.

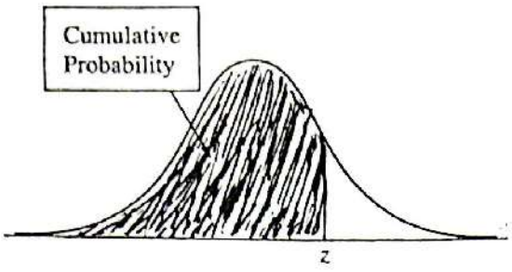

**[5]**

**Q2.** A popular tea brand in Sylhet claims that its automated packaging machine fills exactly 500 grams of tea leaves per packet on average. However, a quality control officer suspects that due to a recent voltage fluctuation, the machine might be under-filling the packets. From historical factory data, it is known that the filling process follows a normal distribution with a known population standard deviation of 10 grams. The officer randomly selects 40 packets from the production line and finds that the sample mean weight is 496 grams. Conduct a hypothesis test at a 5% significance level to determine if there is sufficient evidence to support the officer's suspicion that the average weight is less than 500 grams. **[10]**
